Chapter 4

QBIO 305 FA26

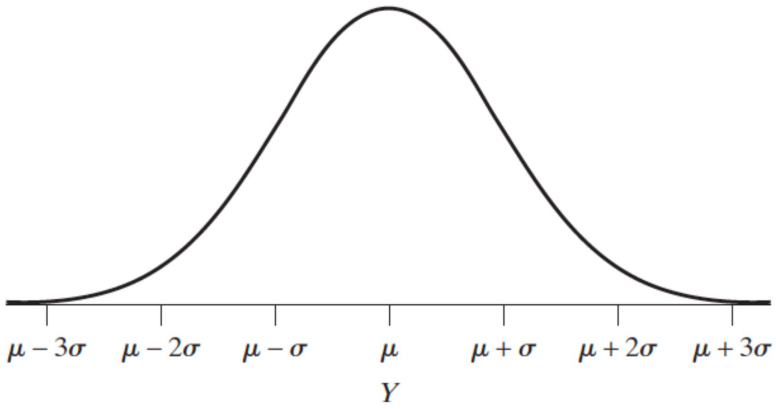

Summary of lecture slides

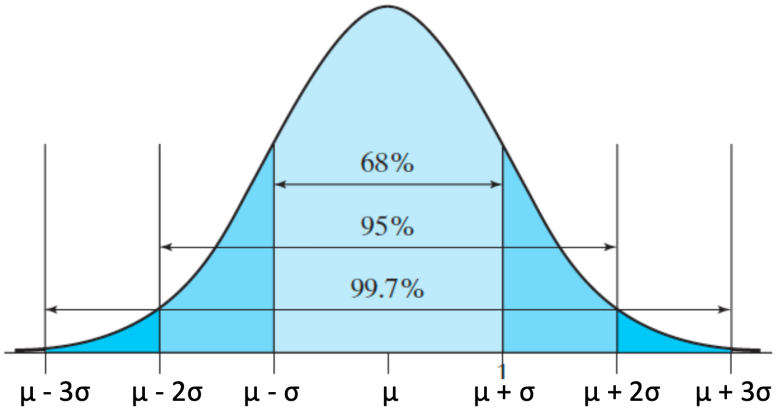

Biases

- Missing data is inevitable in large data sets
- Important to understand how data is collected and if there is any pattern to the missing data

Normal distribution

$$f(y) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{1}{2}\left(\frac{y-\mu}{\sigma}\right)^2}$$

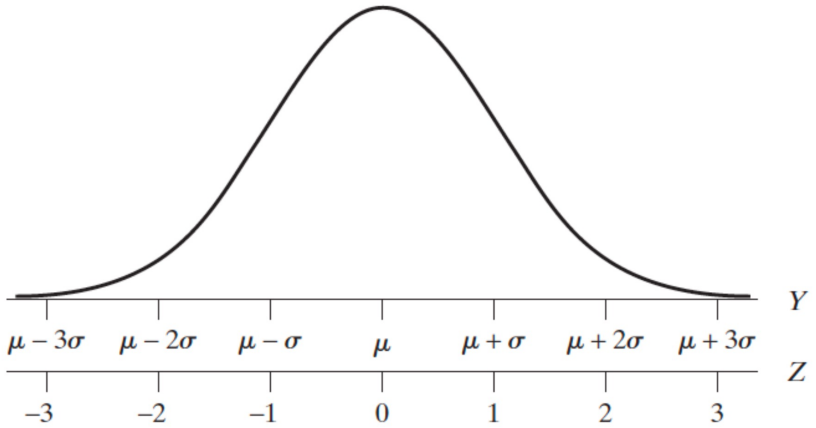

68%
95%
99.7%
μ - 3σ
μ - 2σ
μ - σ
μ
μ + σ
μ + 2σ
μ + 3σ

Normal distribution properties

- Assume Y is normal with mean μ and SD σ
  - Y can be written as N(μ, σ)
- Then we can define $\mathrm{Z} = \frac{Y-\mu}{\sigma}$
  - Z is also normal with mean 0 and SD 1
  - In other words, Z is N(0,1)
  - This is called standard normal

Standardized Scale

Standardization Formula

$$Z = \frac{Y - \mu}{\sigma}$$

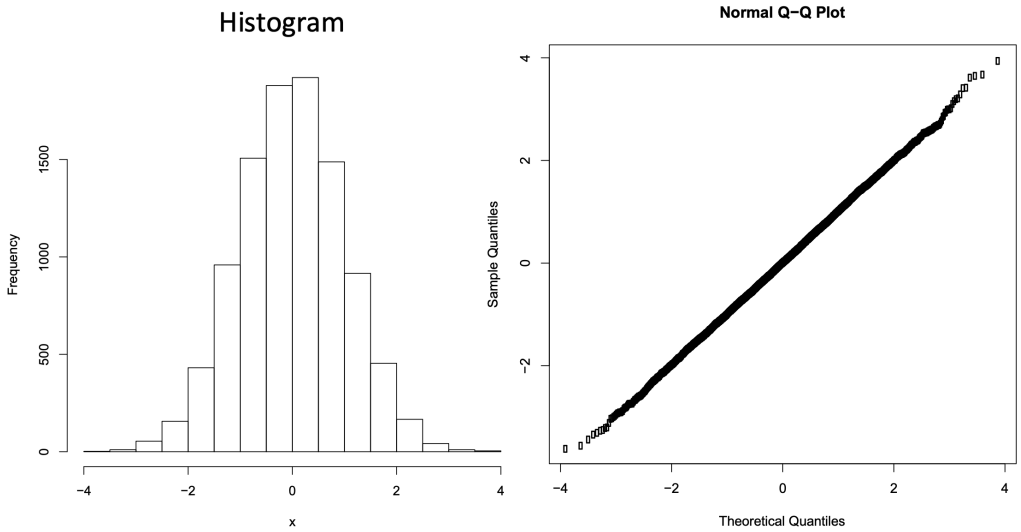

- Lookup table examples
- P(Z=a) = 0

Fish example

- Population of herring is normally distributed
  - Mean 54mm and SD 4.5mm
  - What fraction of fish are less than 60mm long?
    - $\mathrm{Z} = \frac{Y-\mu}{\sigma} = \frac{60-54}{4.5} = 1.33$
    - P(Z<1.33)
  - What fraction of fish are greater than 51mm long?
    - $\mathrm{Z} = \frac{Y-\mu}{\sigma} = \frac{51-54}{4.5} = -0.67$
    - P(Z>-0.67) = 1-P(Z<-0.67) = …

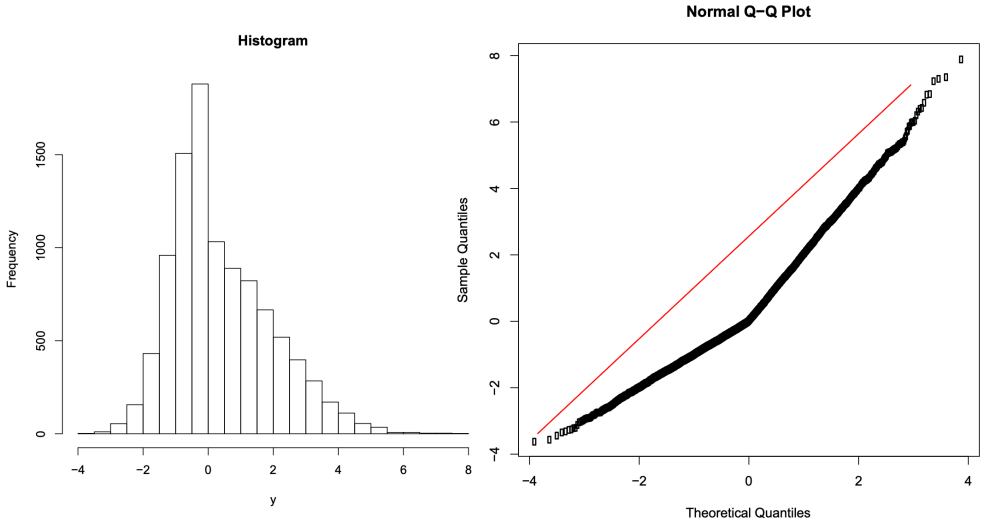

QQ plots

- Test for normality
- Many things are normally distributed
- Order the data from in increasing order
- Assume data is normally distributed and can calculate expected value based on quantile

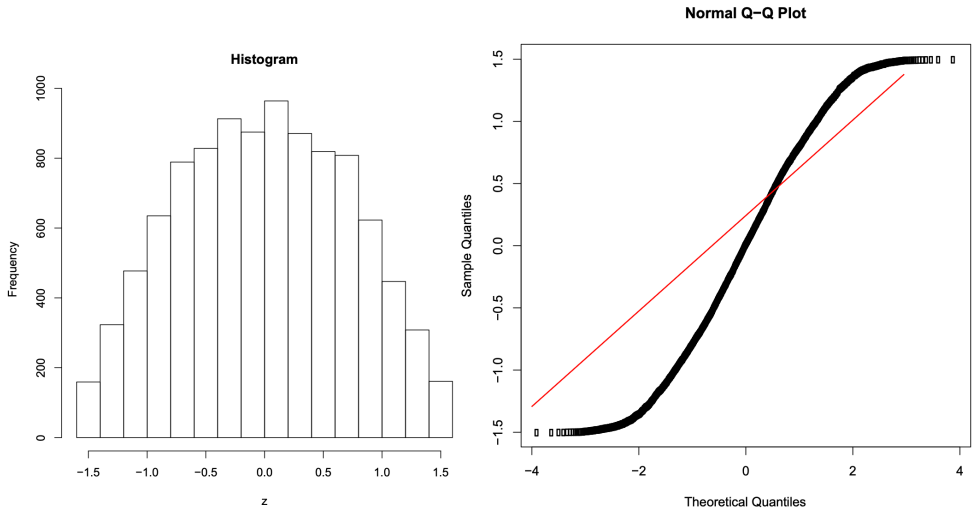

Straight line implies the distribution is normal

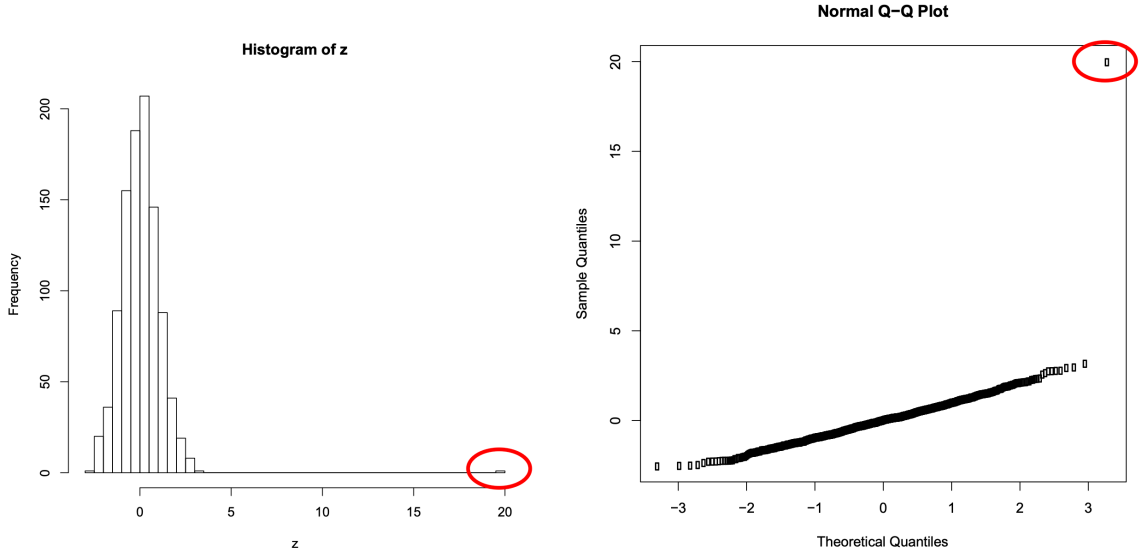

Not straight line implies the distribution is not normal

Not straight (I added the red line for comparison)
So not normal

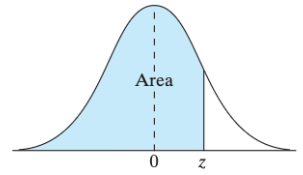

Not straight so not normal

This outlier makes the distribution not normal

Table 3 Areas Under the Normal Curve
